

## **ABSTRACT**

A system and method for visually establishing a trading strategy are described. According to one method, a trader can position a first icon corresponding to a first order and a second icon corresponding to a second order in relation to a first value axis displayed on a graphical interface. A graphical means can also be used in relation to the icons to show that the icons correspond to a trading strategy. The graphical means can include lines, numbers, or any other user-configurable graphical representation illustrating order precedence, for example.
